

On the Subject of Canny Maze

The thing that gets me about these modules is that the instructions are actually well-written, even though we only see images and text. We create the whole solution in our text-editing software, and it turns out correct.

On this module will be an image of Mr. Incredible becoming canny alongside four arrows. These images, or "phases", are numbered 1-7, and are randomly distributed across a square grid with dimensions ranging from 5 to 8.

Clicking on the center of the module reveals the entire maze, and clicking again returns to the current position. In the view of the entire maze, the current position is surrounded by a blue border and the goal by a red border. The module will automatically solve upon reaching the goal. Whichever phase is on the module at first is the type of maze present.

YOUR MAZE IS:  SUM MAZE	YOUR MAZE IS:  DIGITAL MAZE	YOUR MAZE IS:  BINARY MAZE
YOUR MAZE IS:  CAREFUL MAZE	YOUR MAZE IS:  CONDITIONS MAZE	YOUR MAZE IS:  WALLS MAZE
YOUR MAZE IS:  FREE MAZE		

Instructions

Backtracking is always allowed. In the case of more than one phase meeting the necessary conditions for the Sum, Digital, Binary or Conditions Mazes, any applicable phase can be navigated to.

Sum Maze: Sum all orthogonal phases and modulo the current phase (modulo 7 if current phase is 1), then add 1. Whichever surrounding phase is closest or equal to this number is the phase to navigate to.

Digital Maze: Sum all orthogonal phases and take the digital root, then modulo 7 and add 1. Whichever surrounding phase is closest or equal to this number is the phase to navigate to.

Binary Maze: Take the binary representation of the current phase. Whichever phase can be reached by inverting any one bit is the phase to navigate to.

Careful Maze: Can only move up when the last two digits of the timer are a prime number, left/right when timer's last digit matches parity of current phase, and down when the last two digits of the timer are a multiple of the current phase.

Conditions Maze: Can only move up or down if going from an odd phase to an even phase or vice versa, can only move right if moving to a higher phase, can only move left if moving to a lower phase.

Walls Maze: Can move at any time, but must avoid walls (see below page).

Free Maze: Can move wherever whenever, but this is extremely rare.

Walls Maze Maps

Note to self: Develop maps to fill in this part later, perhaps when mod idea is more fleshed out.
